

Tinnitus Self-Help

TinniTool® is described as a revolutionary medical soft laser device developed in Switzerland by DisMark GmbH, conceived so that treatment can be carried out at home (without technical knowledge).

Designed to treat the effects of Tinnitus and similar inner ear disorders, such as partial deafness due to tinnitus, ear pressure, morbus Ménière (dizziness), acute hearing loss and hearing distortion that is becoming an increasingly common condition.

TinniTool® uses soft laser technology to recreate the natural photosynthesis occurring in nature and is completely safe and painless. Damaged sense cells in the ear can be regenerated using a concentrated supply of light energy from TinniTool's® soft laser. The laser beam penetrates the deep subcutaneous layers and acts as a powerful healing bio-stimulation. Whilst not proclaiming to offer a complete cure, DisMark GmbH state it can significantly improve a patient's quality of life. DisMark GmbH is also currently interested in new distribution partners, to take part in enlarging the worldwide marketing and sale of TinniTool®.

DisMark GmbH recommend that Tinnitool® is used in combination with their new tailor-made sound therapy.
